===== xmcd2cue is a command line utility which will convert the contents of your CD catalog into Cue Sheet files. An xmcd CD file is one with CD/DA, CD-DA, CD-I, CD-I64, CD-ZIP, CD-ZOO, CD-R, CD-RW, XCD, XCDD and MD-Z files. xmcd2cue supports the following formats: * xmcd2cue should not be confused with the xmcd CD file format, which is different. * xmcd2cue is compatible with xmcd version 8.4. * xmcd2cue does not need to be installed as part of the xmcd distribution. * xmcd2cue was tested with Linux and Microsoft Windows 7. * xmcd2cue can also convert any file with a.cue extension. xmcd2cue Requirements:

===== * A system that supports the Windows API (Win32) * A CD player, which supports CDs with CD-DA, CD-I, CD-I64 and CD-ZIP files. * Xmcd2cue can be used from the command line, or as a DOS batch

file. * xmcd2cue can be launched by double clicking on a.cue or.xcd file. * xmcd2cue can also be launched from a menu item in a larger application. * xmcd2cue supports any file type with a.cue extension. * xmcd2cue was tested with Linux and Microsoft Windows 7. * xmcd2cue can also convert any file with a.cue extension.

Installation: ===== 1. Install any xmcd CD player. 2. xmcd2cue is installed by default. 3. Launch xmcd2cue by double clicking on the xmcd2cue executable file (run this or use the bat file in the bin sub-folder of the distribution). Usage: ===== xmcd2cue will run a simple text based GUI that will allow you to enter an xmcd CD file name, and the name of a destination Cue Sheet file. All you have to do to convert is enter the name of the CD into the 'CD' field, and enter the name of the destination Cue Sheet file in the 'Destination Cue Sheet

What's New in the XMCD2CUE?

The purpose of this program is to be a simple command line tool that converts xmcd compatible CD descriptor files into .mp3 cue sheets. What are xmcd descriptors? CD Descriptors are standard XML files with a similar structure to .xml files, except the tags are for CD information, such as track titles, artist names, the disc number, etc. The CD Text is usually in the header, and may be split into multiple chunks, separated by blank lines. Each CD Text chunk has a name and a number (index) within the CD text file. This number is used to refer to a particular part of the CD track list. The format of a CD Text chunk is:
... index ... CD Text chunks are parsed and loaded into memory into an in-memory tree. Each track has a Node for the TrackTitle, and a Node for each CD Text chunk. For example, if a track has 3 CD Text chunks, each with 3 chapters, then each CD Text chunk in that track will be contained in a separate Node in the tree. Each Node has a name (TrackTitle) and a number

(Index), in order. The file `xmcd2cue` is used to convert `xmcd` files into `xmcd cue sheet` format. The application reads each track from the CD, parses the CD Text, and then constructs an in-memory representation of the CD from the parsed information. The `cd text` chunks are grouped into Node. The CD's name, artist, and track number are stored for each Node in the tree. Each CD in the tree is referenced by the index number that was assigned to that particular track during the `cd text` parsing process. The index number does not need to match the track number that is used in the `.xml` file, but it must match the index number that is in the CD Text chunk. The application then takes the in-memory tree of Nodes, and writes them out to an `.mp3` file. The `.mp3` file is constructed from the track number for each Node in the tree, and from the index number. It then uses the `.mp3` plugin to write the `.mp3` file out to disk. Here is an example of the `xmcd2cue` conversion in action. `xmcd2cue`

```
#!/bin/sh /usr/bin/xmcd2cue -r  
/home/mytestdata/songs/cd123.xmcd -x  
/home/mytestdata/songs/cd123.xml -o /home
```
